Safe Aircraft Construction

Aircraft are made out of lots of different materials.

Some pilots even build and maintain their own aircraft. There are lots of designs available and some even come as kits which can be put together. When constructing an aircraft strict rules must be followed so that it is safe to fly when finished.

Build your own aircraft out of materials you have at home.

Think about what you will use to construct the main aircraft parts including the Fuselage (the body), Wings, Landing Gear, Flight Control Surfaces and Engine(s).

Maybe you could create an edible aircraft like the one below!
